

The two areas in which we are present in Zambia generally adhere to the same seasons, with one difference: Our camps in the Busanga Plains, Kafue National Park, are only operational in the dry season – from June to the end of October. Below are a few helpful highlights of each time of year in Victoria Falls and Busanga Plains respectively.

JANUARY TO MARCH

- Rise in Zambezi River water levels and thus an increase in volumes flowing over Victoria Falls.
- Excellent photographic opportunities ... great light, colour and subject matter.
- Summer bird migrants present in breeding plumage.

APRIL TO JUNE

- Moderate climate with a mix of the green and dry seasons including the dynamics of a change in season.
- Victoria Falls quite magnificent during the period April to June, but very low in November.

JULY TO OCTOBER

- Diminished water availability results in game attracted to the Zambezi River.
- Drying water sources means high game concentrations on the Busanga Plains, particularly in the second half of this period.
- Victoria Falls were very full at the beginning of this period but dwindled towards the end.
- Cooler and drier time of the year with daytime temperatures rising towards October.

NOVEMBER

- Rains in the Kafue National Park make it difficult to operate camps on the Busanga plains, and camps are closed for the Summer season.
- The Zambezi River water starts dropping, affecting the water flowing over the Victoria Falls.

DECEMBER

- Due to a lower Zambezi River, the volume of water flowing over the Victoria Falls will be at its lowest.
- Early summer rain may start to fall.
- Summer bird migrants present in breeding plumage.
